

SP Gearbox — Ratio & Flange Detail

Which ratio of each size moves, what is inbound per ratio and per PAM flange, what is missing, and exactly what to reorder · Prepared July 30, 2026

84

ratio cells inbound across 9 sizes (12 order batches tracked)

19

cells flagged MISSING (<5 months of estimated need)

4,680

units suggested to reorder across 58 cells

\$170k

FOB value of the full suggested reorder

How this report estimates ratio-level demand (read this first)

Your sales file records only **series + size** (e.g. "SP 50 TIP REDÜKTÖR") — it does not carry ratio or PAM. So the exact sold quantity per ratio cannot be read from any file you have provided.

But your **purchasing behaviour** does record it. Between Dec 26, 2025 and Jun 17, 2026 you placed **12 separate factory order batches** (Dec 26, Dec 26+, Dec 30, Jan 07, Mar 02, Mar 23, Apr 14, May 08, Jun 01, Jun 03, Jun 16, Jun 17). Most are small, repeated back-to-back orders — they mirror what customers were asking for. A ratio you reordered in 8 of 12 batches is a proven mover; a ratio bought once in one big lot is a stock bet.

The model: each size's real sales rate (from the sales file) is split across its ratios using a blend of **how much** and **how often** you ordered each ratio. That gives an estimated monthly need per cell, and dividing the inbound pipeline by it gives months of cover. Verdicts: **MISSING** <5 mo · **Tight** 5–8 · **Balanced** 8–15 · **Heavy** >15 · **One-off** = single-batch small position.

Treat the shares as estimates, not measurements. The moment you add ratio + PAM to sales order lines (Recommendation in Section 5), this whole report becomes exact. A companion Excel (SP_Ratio_Flange_Cell_Model.xlsx) contains every cell with live formulas so you can adjust rates and see cover change.

The two views of the same pipeline

Quantity says where the money sits; frequency says what actually moves. Cells with high frequency but low quantity are your stock-out risks; high quantity + low frequency are your over-stock bets.

Inbound pipeline by size × ratio (units, in transit + in manufacturing)

1 · Ratio detail per size

Per size: what is inbound per ratio, how often you ordered it, the estimated share of that size's sales, months of cover, and the suggested reorder. Rows are the invoice ratios; "Ordered" counts the 12 batches.

Input-flange spares cross-check

800 loose input flanges are inbound (400 on the water + 400 in production, possibly the same lot listed twice — verify): 400× SP 40-71B14, 400× SP 50-80B14, 400× SP 63-90B14, 400× SP 75-90B14 across the two files. These let you re-flange nearby PAM variants of SP 40–75 and partially cover thin B14 cells; they do not help B5 gaps.

3 · What is missing — suggested reorder, cell by cell

Every cell below is under 12 months of estimated cover (and not a one-off). P1 = under 5 months — order immediately; P2 = 5–8 months — include in the Q3 PO; P3 = 8–12 months — top-up if container space allows. Quantities rounded to 5s; values FOB Shanghai.

Notes & how to sharpen this

- This proposal fills every active cell to 12 months. It is larger (~\$170k) than the size-level figure in the previous report (~\$142k) because it also fixes the mix inside sizes that look covered in total. Trim P3 first if budget is tight.
- Do not add SP 50 i:100, SP 63 i:100, SP 90 i:40, SP 130 i:40 or SP 150 i:40 — those cells carry 15–51 months already.
- One-off cells (single batch, small share) got no suggested qty — review them manually; some may be specific customer projects.
- B5 flange variants are inside the cell quantities at their historical proportion; confirm B5/B14 split per line when placing the PO (Excel sheet "PAM-flange cells" gives the per-flange view).
- Estimates use order-frequency + volume blend across 12 batches (see method on page 1). Warehouse stock not included. Add ratio+PAM to sales order lines and this becomes exact.
- Companion file: SP_Ratio_Flange_Cell_Model.xlsx — all 84 ratio cells and 41 PAM cells with live formulas, filters, and the reorder list.
